Hindus, the DNA F, voluntarily moved out of Ethiopia and lived only in Peninsular India for over 60,000 years. They had nothing to do with the current Africans or Europeans. They were highly advanced logic-based cultures. They followed the monsoon winds from the Arabian Sea to the Bay of Bengal. They were rainwater people. They lived only along the perennial rainwater rivers along the path of the monsoon winds. At that time, the seawater was far below the current levels, and Balochistan and Punjab were fertile lands. The Indus River had many rainwater tributaries and was located about 50 miles to the east of the current path. The Baloch Ridge had many rainwater reservoirs that fed rivers on both sides of the ridge.

The following map is a digital image of the landscape when Balochistan and Punjab were fertile lands. The current dry canyons in the mountains were at one time reservoirs of rainwater. People moved from Balochistan to Punjab along the rainwater rivers.
