

The DNA C in Alaska, an Archeological View by Potluri Rao In Seattle ©2018 (CC BY 4.0)

The above map is a computer-generated landscape of 60,000 years ago, when much of the world was covered with glaciers, and the seawater was far below the current levels. The Red Sea was a giant lake of freshwater, the Persian Gulf was a fertile valley, the land from Bangladesh to Australia was Sunda, and Russia and Alaska were connected.

One hundred thousand years ago, two highly advanced logic-based cultures, the DNA C and F, evolved at the Victoria Lake in Africa. Eighty thousand years ago, they discovered a mountain pass and moved east to reach the Red Sea Lake, a giant oasis with an inexhaustible supply of rainwater.

Twenty thousand years ago, the glaciers started to melt. The current sea levels were reached 10,000 years ago. The rising sea levels gradually swallowed much of the land. The C and F were forced to relocate.

The computer-generated landscape of 60,000 years ago offers a new perspective on the history of human migrations. The archeological evidence has a fascinating story to tell.
