An analysis of DNA samples and Census 2011 data on Indian dialects revealed that Hindu (DNA F) never lived along the Himalayas or any of its rivers. They lived only in the Peninsular India for over 60,000 years. They lived only along perennial rainwater rivers. They avoided the Himalayas and its snowmelt water rivers like the plague.

All the Himalayan rivers carry rocks and silt. The rocks accumulate into beaver dams and backlog water into temporary lakes. Himalayan rivers have hundreds of beaver dams of various sizes. Once in a while, heavy rains break all the dams at the same time inundating the land with flash floods that take several months to drain.

Hindu lived there long enough to realize the frequent natural disasters. They avoided the Himalayas and its snowmelt water rivers like the plague.

People who lived along the Himalayas and its rivers were the recent European immigrants (DNA R1) who entered India via Bactria only 4,000 years ago.
