

Rainwater People: An Archeological View

Monsoon winds blow from the Arabian Sea to the Bay of Bengal. The Homo Sapiens who grew up along the path of monsoon winds were the Asian Homo Sapiens. They lived only along lowlands (<1000') with perennial rainwater. The following elevation map shows the lowlands (light blue, green, yellow, and orange) favored by the Asian Homo Sapiens. They followed the path of monsoon winds to reach Peninsular India. They left Somalia and Ethiopia 100,000 years ago. They had nothing to do with the African or European Homo Sapiens who had different tastes. They were warm-climate people. They lived only to the south of the Tropic of Cancer, warm and toasty. One hundred million years ago, India was attached to Somalia and Madagascar. The unique geology of lowlands was formed when the plates were separated. The glaciers started to melt 20,000 years ago, and much of the original migration path is now submerged under 500 feet of water. The DNA samples are consistent with the geology.
