Hindus (DNA F) are Asian Homo Sapiens. They had nothing to do with the African or European Homo Sapiens. They voluntarily left Ethiopia (Africa) 100,000 years ago and followed the monsoon winds from the Arabian Sea to the Bay of Bengal. They lived in the currently submerged Persian Gulf from 80,000 BCE to 10,000 BCE. The glaciers started to melt around 20,000 BCE, and the Gulf was totally submerged.

To understand the migration path of Hindus, we need to understand the geology. Not all of Asia was suitable for human habitation. The land below the waterline was prone to floods and natural disasters. The land above the treeline was not arable.

We digitally reconstructed the landscape as perceived by Hindus at the time they voluntarily left Africa in search of dependable perennial rainwater resources. They sent out scouts far and wide in search of habitable lands. They were highly advanced logic-based cultures. They were warm-climate people and lived only to the south of the Tropic of Cancer, warm and toasty. They avoided the Indus River of snowmelt water.
