

Hindu Dialects as Recorded in the Census 2011

The Census 2011 recorded almost 2,000 dialects of various sizes currently in use in India. The following is a list of some of the major commonly recognizable dialects with substantial size. Maps of the dialects by size and location are at the end.

An analysis of DNA samples of the Indian populations revealed that all these dialects belonged to the DNA F. The F were Asia Homo Sapiens, not Europe Homo Sapiens. They voluntarily left Ethiopia (Africa) 100,000 years ago and lived only to the east of the Red Sea, to the south of Tropic of Cancer, along the Equator, warm and toasty. They never heard of glaciers, Ice Age, or Stone Age. They were rainwater people. They avoided the Himalayas and its snowmelt water rivers like the plague. They followed the same migration path as Homo Erectus (Java Man) before them. Culturally, they were the exact opposite of the warmongering Europeans constantly at war to rob each other.

The linguistic data reinforced the DNA findings that the native Indians (Hindu) were the F. The F were the only people on the subcontinent, until Europeans (R1) migrated to India 4,000 years ago via Bactria and lived only along the Indus river.

The F and R1 were separated by 1,000 miles. There was no reason for population mobility between the two worlds until the Greek colonialists occupied both sides and established the current political boundaries of modern India. What is currently taught as the Indian history is history of the R1, the European immigrants.

The DNA O, J2b, H, and L are subgroups of the F. The dialects are numbered by subgroup for easy identification in the maps presented below.

The archeological evidence has a fascinating story of the now lost history of the F to tell.
