

DNA Distribution in India

The current version of ancient Indian history was written by people who lacked scientific skills. It was mostly fiction invented by the Greek colonialists to promote their own agenda. There is ample DNA research to reconstruct the Indian history based on a scientific foundation.

People who share the same DNA are called a Haplogroup. Haplogroups are categorized from A to Z. Density maps of DNA revealed migration paths of the past.

An analysis of DNA samples of the Indian populations revealed that there are only two major Haplogroups in India: (1) Hindu (DNA F), and (2) European immigrants (DNA R1). The DNA H, L, J2b, and O are subgroups of the F. The DNA C passed through India to China.

The migration paths of the India DNA groups revealed a fascinating story of human history of the past 100,000 years. The C and F are a distinct category of Homo Sapiens that left Africa and evolved as the most intelligent humans ever lived on this planet. Unfortunately, their story is now lost. Their cultures were deliberately and totally destroyed by the Europe Homo Sapiens, the R1. The story of the R1 is actively promoted as the human history.

The mountain range to the west of the Red Sea separated Asia from Africa. The Red Sea is in Asia, not Africa.

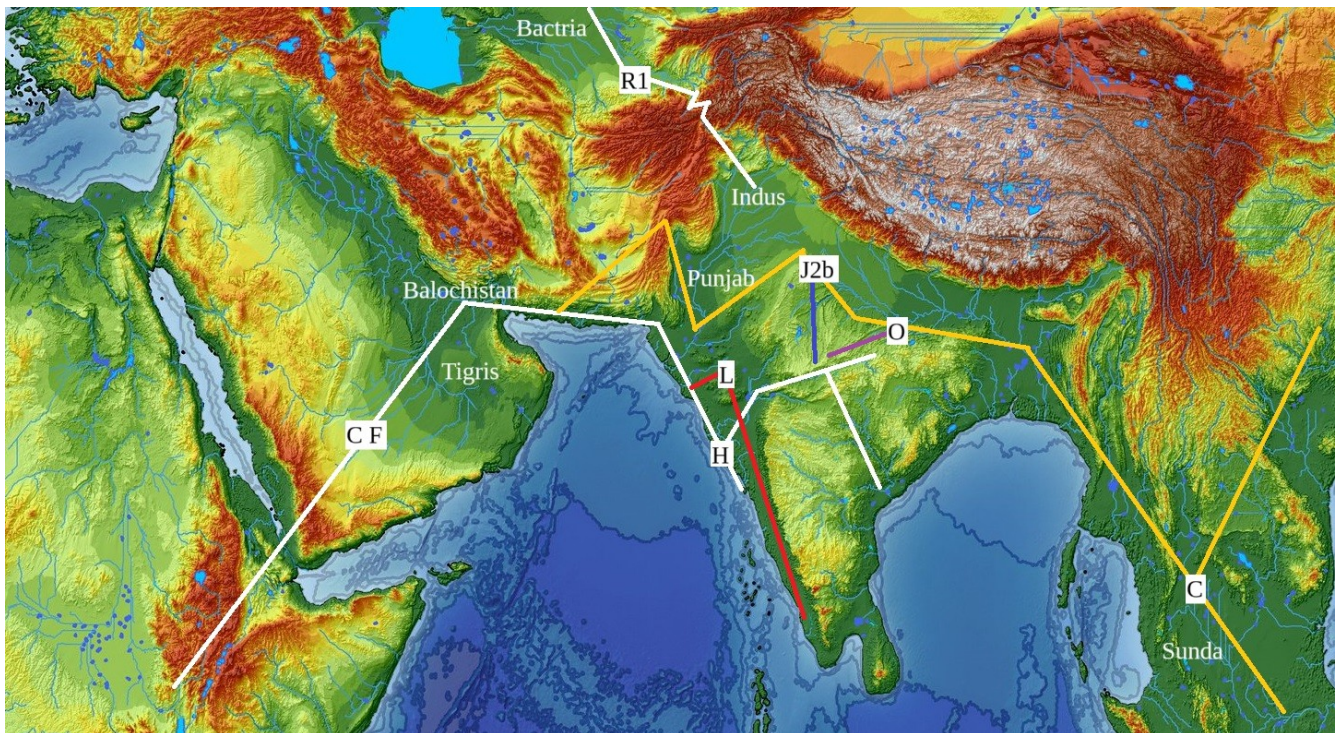

Hindu (F) and China (C) were the Homo Sapiens who moved from Ethiopia (Africa) to the Red Sea (Asia), 100,000 years ago, and evolved as an independent category, the Asia Clade. They lived only in the Tropical Zone, along the Equator, only along rainwater rivers, to the east of the Red Sea. They were warm and toasty. They had nothing to do with the Homo Sapiens of Africa (A, B) or Europe (R1). They had nothing to do with the Ice Age or Stone Age. They were an advanced logic based culture of visionaries and pioneers who discovered life sustaining perennial rainwater resources in Asia and voluntarily moved out of Africa.

Europe was covered with glaciers until as recently as 20,000 years ago. It was a swamp and was habitable only after 10,000 years ago. The Europe Homo Sapiens (R1) were the Ice Age and Stone Age people, the Europe Clade. They evolved as warmongers,

constantly at war to rob each other, for the scarce food in the swamp lands. They migrated south 4,000 years ago, during a prolonged drought, and moved to India.

Hindu (F), lived only in Asia, for 100,000 years, only along rainwater rivers, to the south of the Tropic of Cancer. The R1 were the Europe Clade who moved to India only 4,000 years ago and lived only along the snowmelt water rivers of the Himalayas.

Hindu (F) avoided the Himalayas and its rivers like the plague. They never lived to the north of the Tropic of Cancer. The R1 lived only along the Himalayas. The F and R1 were unaware of each other until Greeks occupied both sides of the Yamuna.

The above map is a computer generated landscape of 60,000 years ago, when much of the world was covered with glaciers and the seawater was far below the current levels.

At the time the Asia Clade moved from the Red Sea to India, the Red Sea was a giant lake, the current Persian Gulf was the Tigris river, the current Gulf of Oman was Balochistan, the current Thar desert was a fertile valley Punjab, and the land from Bangladesh to Australia was a giant fertile valley Sunda.

The migration paths as revealed by the DNA samples of the Indian populations are presented by different lines. People lived only along the lines. All the lines were along perennial rainwater rivers. The L lived only on the West Coast of India. The H lived

only along the Narmada river. They moved to the East Coast along the Godavari river. The O lived only along the Sone river and in Sunda. The J2b lived only along the Ken river.

The C and O moved from Balochistan to Sunda, along the yellow line, the Yamuna river. They lived in Sunda from 60,000 BCE to 20,00 BCE. Sunda was submerged when the glaciers started to melt. The C moved east to China. The O moved to the Sone river.

The C and O in Sunda, painted caves of the animals they hunted for food. The paintings were dated to be more than 50,000 years old. They are a solid proof that the Asia Clade were along the Equator, warm and toasty, by at least 60,000 BCE. The superb technical skills of the paintings are a proof that they were the most intelligent Homo Sapiens ever lived on this planet at that time.

The Asia Clade lived only along perennial rainwater rivers. They avoided the Himalayas and its rivers like the plague. They lived only to the south of the Tropic of Cancer, in the Tropical Zone, to the east of the Red Sea, for 100,000 years.

The people who lived along the Himalayas were the recent immigrants, the Europe Clade (R1). Culturally, they were the exact opposite of the Asia Clade. They evolved from the Stone Age. They were warmongers. War and god were trademarks of the R1. They deliberately and totally destroyed the cultures of the Asia Clade that did not agree with them. They wrote the books on human history. It was the history of the R1.

The DNA samples of Indian populations have a fascinating story to tell.
