

## Indus Canyon: An Archeological View

Originally, 100 million years ago (100 Ma), India and Madagascar were attached to Africa. They were separated, and India drifted north and collided with the Europe plate to form the current India. The place where the two plates were fused was a giant canyon called the Indus Canyon. It separates the Baloch and Aravalli ridges of the two plates. The following maps show when and how the canyon was formed. The current Indus River is the borderline between the two plates.

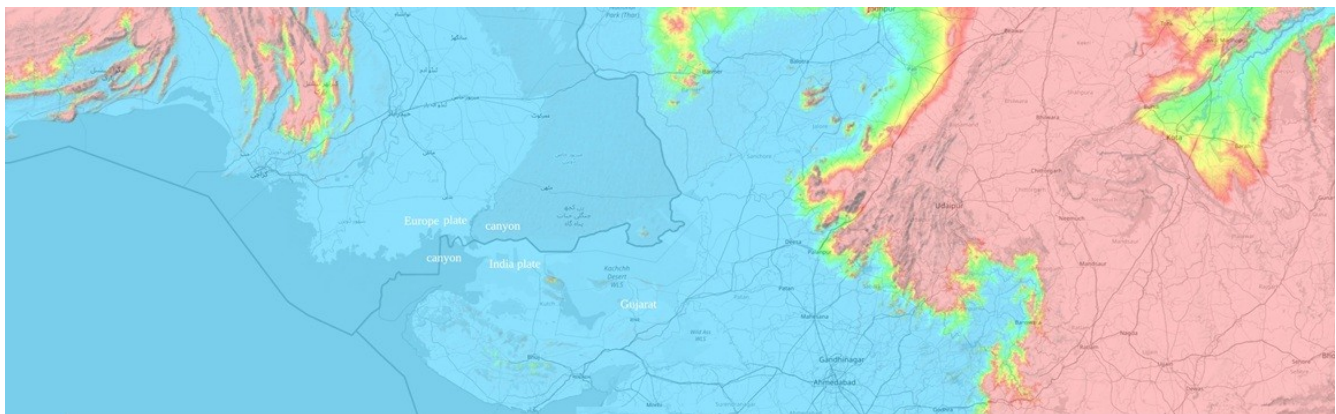

Before the glacial melt, the west coast of India extended over 200 miles to reach the then Arabian Sea. The Narmada and Indus deltas are now under 500 feet of water. They were separated by the Indus Canyon. Hindus (DNA F) were rainwater people. They lived only in the lowlands of perennial rainwater rivers of the Baloch and Aravalli ridges. They avoided the canyon of flatland between the two ridges, which was a flood basin.

Indian monsoon winds blew from the Arabian Sea to the Bay of Bengal for 20,000 years and reversed direction and blew from the Bay of Bengal to the Arabian Sea for another 20,000 years due to the Earth's rotation, called axial tilt.

Sixty thousand years ago, the monsoon winds blew west to east, and the white line in the map had an abundant supply of rainwater. Forty thousand years ago, the winds reversed direction, and the white line became the Thar Desert, deprived of rainwater. Twenty thousand years ago, the Narmada Delta was submerged due to glacial melt.

The elevation map has a fascinating story to tell of the Hindu migration from the Persian Gulf to Peninsular India. Hindus are Asian Homo Sapiens; they had nothing to do with the African or European Homo Sapiens. They voluntarily left Somalia 100,000 years ago. They lived only in lowlands of the perennial rainwater rivers along the path of the monsoon winds from the Arabian Sea to the Bay of Bengal.
